Int temp : Integer

Q3: procedure temp_input (r : int, c : int, temp[r][c] : ~~float~~ array of real)

```
for i = 1 to r
  for j = 1 to c
  output "Enter temp"
  Input temp[i][j]
```

procedure sensor_analysis (r : int, c : int, temp[r][c] : array of real, average[r] : array of real)

~~float~~

```
Hightest, lowest, total, avg : Real
highest, lowest, total, avg ← 0.0
C_cont, w_cont, max_cont : Integer
c_cont, w_cont, max_cont ← 0
for i = 1 to r
    highest = temp[i][0]
    lowest = temp[i][0]
    max_cont, w_count, c_count ← 0
    total, avg ← 0.0
    for j = 1 to c
        total += temp[i][j]
      if temp[i][j] > highest
        highest ← temp[i][j]
    else if temp[i][j] < lowest
        lowest ← temp[i][j]
    if temp[i][j] >= 35
        max_cont += 1
        if temp[i][j] >= 40
        ccount += 1
```

Date _____

find_highest_avg(sensors, average)[])

→ Input:
1. rows
2. cols
3. temp readings

→ Output
✓ for each sensor:
1. total sum of temp
2. avg temp
3. maximum temp
4. minimum temp
5. count of critical readings and warning readings.
6. longest consecutive hot streak.

~~→ Also the overall sum~~

→ the sensor too with the highest overall avg temp.
